PREMIUM GLASS FILTER MEDIA

GLASS CRYSTALS™

PREMIUM POOL FILTER MEDIA

- ✓ Made from virgin crushed glass.
- ✓ Contains zero impurities.
- ✓ Increases flow rates & circulation.
- ✓ Cleaner & faster backwashing.
- ✓ Up to 3x longer life than sand media.
- ✓ Filters down to 3 microns.

Made from 100% virgin crushed glass, Evoclear Glass Crystals contains zero impurities, providing a clean and consistent filtration media from the outset. Its premixed blend of coarse and fine media simplifies installation while delivering efficient filtration for immaculate pool water.

Achieve Immaculate Water

- Made from 100% virgin crushed glass.
- Zero impurities and no contaminants ensure the cleanest possible filtration.
- Removes more materials and pollutants than sand, significantly reducing chemical use.
- Increased flow rates resulting in better pool water circulation and shorter filtration cycles.
- Less likely to block or channel in the filter bed than sand or other media.
- Up to 25% less filter media required compared with silica sand.
- Reduces pump workload, resulting in lower energy use and increased pump longevity.
- Lasts up to 3 times longer than sand, Evoclear glass degrades very slowly due to the advanced heat treatment process.
- Supplied in a pre-mixed grade, eliminating the need to use fine and coarse grades.
- Less susceptible to biofouling due to the uniform surface structure of the glass.
- Filters finer contaminants all the way through the media bed, eliminating issues of contaminants clogging on the bed surface.

Pre-Mixed Grade

Evoclear Glass Crystals is conveniently supplied as a combined fine and coarse grade media comprising of 1-3mm particles. This grade has been carefully formulated and mixed to result in ideal particle distribution throughout the entire filter bed, providing excellent filtration.

Reduced Bacteria

Evoclear Glass Crystals are less susceptible to biofouling (accumulation of bacteria) than sand media. The heat treated surfaces of Evoclear glass particles are uniform, so bacteria can not become trapped in cracks or flaws, requiring less remedial action and less chemical treatment to destroy pollutants.

Silica sand contains cracks and flaws on the surface.

Glass Crystals have a sharp, uniform surface.
